SUMMARY

Software Engineer, with three years at Thomson Reuters. Worked on SurePrep's tax automation applications and agents, processing millions of tax documents a year, serving thousands of accountants. Extended and supported the 1040 preparation workflow through backend services, the integration pipelines feeding it, the document-upload front end, and the database server underneath.

EDUCATION

George Mason University, Fairfax, Virginia **GPA: 3.96/4.0**
Master of Science in Computer Science Jan 2025 - May 2027
Courses: System Programming, Analysis of Algorithm, Database Management, Network Security, User Interface & Design, SWE World Wide Web

University of Mumbai, India **GPA: 9.40/10**
Bachelor of Engineering in Information Technology Aug 2019 - May 2022
Courses: Data Structures & Algorithms, Operating System, Automata Theory, Natural language Processing, Computer Networks, Cryptography

WORK EXPERIENCE

Thomson Reuters, Mumbai, India ***July 2022 – Jan 2025***

Senior Software Engineer ***Mar 2024 – Jan 2025***

- Architected bidirectional C#/.NET integration agent connecting UltraTax CS and SPBinder, using WinForms, JSON deserialization, schema mapping, and SQL Server stored procedures to process 8,000+ fields across 5 tax return types for 23,000 tax professionals, saving 20 hours/week.
- Optimized 250+ LINQ/Entity Framework queries using SQL execution plans, composite indexes, AsNoTracking, and N+1 query elimination, reducing W-2 processing latency by 30% (400ms to 280ms) and peak SQL Server load by 25%.
- Resolved Azure VM-hosted background processing failures by debugging Azure Service Bus queues, XML parsing, corrupted payloads, retry mechanisms, and dead-letter queues, restoring stalled binder jobs on a platform supporting 1.2M tax returns.
- Migrated 4 repositories from TFS to GitHub, implementing GitHub Actions CI/CD pipelines with YAML workflows, automated builds, unit tests, and deployment artifacts, reducing production release time by 37%.

Software Engineer ***May 2023 – Mar 2024***

- Replaced legacy WCF-based document upload service with native C#/.NET file processing using StreamWriter, REST APIs, and dynamic file selection, eliminating external agent dependencies and reducing upload latency by 200ms.
- Managed production deployments across 5 Azure VMs and 3 Azure App Services, configuring IIS application pools, HTTP bindings, and Azure DevOps release pipelines, supporting ~20 deployments per quarter.
- Engineered reusable logging library using Serilog NuGet, structured logging sinks, correlation IDs, and exception tracking, implementing dual-output logging and automated 10-day retention across application services.

Trainee Software Engineer ***July 2022 – May 2023***

- Built a configurable maintenance webpage using ASP.NET MVC to schedule SQL Server shutdowns, supporting 99.9% service availability.
- Enhanced VB.NET/WPF monitoring tool using MVVM, and data binding to improve infrastructure visibility and production stability.
- Automated 40+ regression tests using Selenium WebDriver, NUnit, and Page Object Model to validate critical workflows and UI components.

PROJECTS

LexVault **404Meet/LexVault**

- Built a python-based local-first Contract Intelligence System (5 Agno agents, qwen2.5:7b LLM, zero cloud calls) that turns any legal PDF/DOCX into clause risk scores (1-10), live market benchmarks via Brave MCP server, and a sign/negotiate/walk-away verdict in under 5 minutes.
- Ran every inference on-device via Ollama, making network egress architecturally impossible, keeping sensitive legal data fully private while delivering multi-perspective analysis.
- Parallelized 40% of the agent pipeline (risk scoring and market benchmarking agents) with asyncio.gather, cutting 20% of total runtime by eliminating one full qwen2.5:7b inference round-trip, and streamed all 5 stages through a per-job asyncio.Queue with no client polling.
- Designed an Angular frontend with a WebSocket-driven 5-stage progress tracker over a FastAPI backend, handling file ingestion, per-job WebSocket streams, and Pydantic-validated report delivery.

Karya **404Meet/Karya**

- Built Karya, a C#/.NET MCP server that gives AI clients (Claude, Cursor, Codex, IDE agents) structured, real-time access to API discovery, architecture, and framework guidance across 1,500+ public APIs and 7,000+ OpenAPI specs.
- Shipped a stateless HTTP/SSE server exposing 13 tools, 7 resources, and 4 prompts through the standard MCP interface, consumable from any of 9 official language SDKs.
- Cut API discovery latency to sub-10ms by warming an in-memory cache at startup (24-hour TTL) and eliminating cold-start thundering herd with a SemaphoreSlim double-check locking pattern.
- Curated framework, DTO, mapping, and architecture guidance for greenfield API design, grounding AI clients in current standards rather than stale training data.

TECHNICAL SKILLS

Languages:	C#, Java, Python, Visual Basic, JavaScript, TypeScript, SQL, HTML, CSS.
Backend & Frameworks:	.NET, ASP.NET, Spring Boot, Node.js, Angular, React.js, Vue, FastAPI.
Cloud & Database:	AWS, Azure, MSSQL, MySQL, PostgreSQL, MongoDB.
DevOps & Testing:	Azure DevOps, GitHub Actions, TFS, NUnit/xUnit, Selenium, Jenkins, Docker.
Fundamentals:	Microservices, OAuth/JWT, NLP, LLMs, Multi-Agent Systems, MCP, Agile/Scrum.

ACHIEVEMENTS & HIGHLIGHTS

- Certifications: Python for Everybody, Professional Scrum Master – I, Microsoft .NET FSD
- Authored two published technical articles: Working with Geospatial Data in Python and Natural Language Processing, with combined views exceeding **568,000** on GeeksForGeeks.
